

1 Party Tricks

$\nearrow \text{(mod 10)}$ 來去定理

Note 6 You are at a party celebrating your completion of the CS 70 midterm. Show off your modular arithmetic skills and impress your friends by quickly figuring out the last digit(s) of each of the following numbers:

- (a) Find the last digit of 11^{3142} .

$$\underbrace{1}_{1 \equiv 1 \pmod{10}} \Rightarrow 11^{3142} \equiv 1^{3142} \equiv 1 \pmod{10}.$$

- (b) Find the last digit of 9^{9999} .

$$q^0 = 1 \quad q^1 = 9 \quad q^2 = 81 \quad q^3 \rightarrow \underbrace{q^{9999}}_{\equiv 1 \pmod{10}} \equiv 1 \pmod{10}$$

- (c) Find the last digit of 3^{641} .

$$3^0 = 1 \quad 3^1 = 3 \quad 3^2 = 9 \quad 3^3 = 27 \quad 3^4 = 81 \quad 3^5 = 3 \quad q \equiv -1 \pmod{10}$$

$$641 \equiv 2 \pmod{3} \rightarrow 3^{641} \equiv 9 \pmod{10} \equiv 9 \pmod{10}$$

$$2 \sqrt[320]{641} \rightarrow \text{proof? } 3^{2 \times 320 + 1} \\ q^{320} \times 3 \equiv (-1)^{320} \times 3 \equiv 3 \pmod{10} \\ x = 16k_1 + 3$$

2 Modular Potpourri

Note 6

Prove or disprove the following statements:

- (a) There exists some $x \in \mathbb{Z}$ such that $x \equiv 3 \pmod{16}$ and $x \equiv 4 \pmod{6}$.

$$16k_1 + 3 \equiv 6k_2 + 4 \pmod{10}$$

$$(16k_1 - 6k_2) \equiv 1 \pmod{10} \quad 2 \times (8k_1 - 3k_2) \equiv 1 \pmod{10} \quad \text{impossible.}$$

- (b) $2x \equiv 4 \pmod{12} \iff x \equiv 2 \pmod{12}$.

$$\left. \begin{array}{l} x = 12k + 2 \\ 2x = 24k + 4 \end{array} \right\} \quad \left. \begin{array}{l} x = 6k + 2 \\ 2x = 12k + 4 \end{array} \right\}$$

- (c) $2x \equiv 4 \pmod{12} \iff x \equiv 2 \pmod{6}$.

$$\left. \begin{array}{l} x = 6k + 2 \\ 2x = 12k + 4 \end{array} \right\} \quad \rightarrow \text{true}$$

3 Modular Inverses

$$a(x-x') \equiv 0 \pmod{m}$$

$$ax \equiv 1 \pmod{m} \Leftrightarrow ax - x' \equiv 0 \pmod{m}$$

Note 6 Recall the definition of inverses from lecture: let $a, m \in \mathbb{Z}$ and $m > 0$; if $x \in \mathbb{Z}$ satisfies $ax \equiv 1 \pmod{m}$, then we say x is an **inverse of a modulo m** .

Now, we will investigate the existence and uniqueness of inverses.

(a) Is 3 an inverse of 5 modulo 10?

No $3 \cdot 5 = 15 \equiv 5 \pmod{10}$

(b) Is 3 an inverse of 5 modulo 14?

$$3 \cdot 5 = 15 \equiv 1 \pmod{14}$$

Yes

(c) For all $n \in \mathbb{N}$, is $3 + 14n$ an inverse of 5 modulo 14?

$$(3+14n) \cdot 5 = 15 + 14n \cdot 5 \equiv 1 \pmod{14}$$

Yes

(d) Does 4 have an inverse modulo 8?

No, if have $4x \equiv 1 \pmod{8}$ $\rightarrow 4x-1 \equiv 0 \pmod{8}$ impossible

$x = 0, 1, 2, 3, 4, 5, 6, 7$ is not, all is not

(e) Suppose $x, x' \in \mathbb{Z}$ are both inverses of a modulo m . Is it possible that $x \not\equiv x' \pmod{m}$?

impossible.

$$ax \equiv 1 \pmod{m}$$

$$a(x-x') \equiv 0 \pmod{m}$$

$$a(x-x') \equiv km \Rightarrow a \neq 0$$

$$\gcd(a, m) = 1$$

$$x-x' = \frac{k}{a}m$$

$$x \equiv x' \pmod{m}$$

Note 6 The Fibonacci sequence is given by $F_n = F_{n-1} + F_{n-2}$, where $F_0 = 0$ and $F_1 = 1$. Prove that, for all $n \geq 1$, $\gcd(F_n, F_{n-1}) = 1$.

for $n=1$ $\gcd(F_1, F_0) = \gcd(1, 0) = 1$ true Induction

$k \leq n$, is true

$$k=n+1 \quad \gcd(F_{n+1}, F_n) = \gcd(F_n, F_{n-1})$$

$$F_{n+1} - F_n = F_{n+1} - \left\lfloor \frac{F_{n+1}}{F_n} \right\rfloor * F_n$$

$$= F_{n+1} - \frac{F_n + F_{n-1}}{F_n} = F_{n+1} - F_n = F_{n-1}$$
