Lab 6: Nonlocal & Generators

(1) inst.eecs.berkeley.edu//~cs61a/sp20/lab/lab06

Starter Files

Download <u>labo6.zip</u>. Inside the archive, you will find starter files for the questions in this lab, along with a copy of the Ok autograder.

Submission

By the end of this lab, you should have submitted the lab with python3 ok --submit. You may submit more than once before the deadline; only the final submission will be graded. Check that you have successfully submitted your code on okpy.org.

Topics

Consult this section if you need a refresher on the material for this lab. It's okay to skip directly to the questions and refer back here should you get stuck.

Required Questions

Nonlocal Codewriting

For the following question, write your code in laboo.py.

Q1: Make Adder Increasing

Write a function which takes in an integer n and returns a one-argument function. This function should take in some value x and return n + x the first time it is called, similar to $make_adder$. The second time it is called, however, it should return n + x + y = 11, then n + x + 2 the third time, and so on.

```
def make_adder_inc(n):
    """
    >>> adder1 = make_adder_inc(5)
    >>> adder2 = make_adder_inc(6)
    >>> adder1(2)
    7
    >>> adder1(2) # 5 + 2 + 1
    8
    >>> adder1(10) # 5 + 10 + 2
    17
    >>> [adder1(x) for x in [1, 2, 3]]
    [9, 11, 13]
    >>> adder2(5)
    11
    """
    "*** YOUR CODE HERE ***"
```

Use Ok to test your code:

python3 ok -q make_adder_inc

Q2: Next Fibonacci

Write a function make_fib that returns a function that returns the next Fibonacci number each time it is called. (The Fibonacci sequence begins with o and then 1, after which each element is the sum of the preceding two.) Use a nonlocal statement!

```
def make_fib():
    """Returns a function that returns the next Fibonacci number
    every time it is called.
    >>> fib = make_fib()
    >>> fib()
    >>> fib()
    >>> fib()
    >>> fib()
    >>> fib()
    >>> fib2 = make_fib()
    >>> fib() + sum([fib2() for _ in range(5)])
    12
    >>> from construct_check import check
    >>> # Do not use lists in your implementation
    >>> check(this_file, 'make_fib', ['List'])
    True
    "*** YOUR CODE HERE ***"
```

Use Ok to test your code:

```
python3 ok -q make_fib
```

Generators

Generators also allow us to represent infinite sequences, such as the sequence of natural numbers (1, 2, ...).

```
def naturals():
    """A generator function that yields the infinite sequence of natural
    numbers, starting at 1.

>>> m = naturals()
    >>> type(m)
    <class 'generator'>
    >>> [next(m) for _ in range(10)]
    [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
    """
    i = 1
    while True:
        yield i
        i += 1
```

Q3: Scale

Implement the generator function <code>scale(it, multiplier)</code>, which yields elements of the given iterable <code>it</code>, scaled by <code>multiplier</code>. As an extra challenge, try writing this function using a <code>yield from</code> statement!

```
def scale(it, multiplier):
    """Yield elements of the iterable it scaled by a number multiplier.

>>> m = scale([1, 5, 2], 5)
>>> type(m)
    <class 'generator'>
>>> list(m)
    [5, 25, 10]

>>> m = scale(naturals(), 2)
>>> [next(m) for _ in range(5)]
    [2, 4, 6, 8, 10]
    """
    "*** YOUR CODE HERE ***"
```

Use Ok to test your code:

```
python3 ok -q scale
```

Q4: Hailstone

Write a generator that outputs the hailstone sequence from homework 1.

Here's a quick reminder of how the hailstone sequence is defined:

- 1. Pick a positive integer n as the start.
- 2. If n is even, divide it by 2.

- 3. If n is odd, multiply it by 3 and add 1.
- 4. Continue this process until n is 1.

For some extra practice, try writing a solution using recursion. Since hailstone returns a generator, you can yield from a call to hailstone!

Use Ok to test your code:

```
python3 ok -q hailstone
```

Submit

Make sure to submit this assignment by running:

```
python3 ok --submit
```
