Note: Your TA may not get to all the problems. This is totally fine, the discussion worksheets are not designed to be finished in an hour. The discussion worksheet is also a resource you can use to practice, reinforce, and build upon concepts discussed in lecture, readings, and the homework.

1 FFT Intro

We will use ω_n to denote the first n-th root of unity $\omega_n = e^{2\pi i/n}$. The most important fact about roots of unity for our purposes is that the squares of the 2n-th roots of unity are the n-th roots of unity.

Fast Fourier Transform! The Fast Fourier Transform FFT(p,n) takes arguments n, some power of 2, and p is some vector $[p_0, p_1, \dots, p_{n-1}]$.

Treating p as a polynomial $P(x) = p_0 + p_1 x + \ldots + p_{n-1} x^{n-1}$, the FFT computes the following matrix multiplication in $\mathcal{O}(n \log n)$ time:

$$\begin{bmatrix} P(1) \\ P(\omega_n) \\ P(\omega_n^2) \\ \vdots \\ P(\omega_n^{n-1}) \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 & \dots & 1 \\ 1 & \omega_n^1 & \omega_n^2 & \dots & \omega_n^{(n-1)} \\ 1 & \omega_n^2 & \omega_n^4 & \dots & \omega_n^{2(n-1)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & \omega_n^{(n-1)} & \omega_n^{2(n-1)} & \dots & \omega_n^{(n-1)(n-1)} \end{bmatrix} \cdot \begin{bmatrix} p_0 \\ p_1 \\ p_2 \\ \vdots \\ p_{n-1} \end{bmatrix}$$

If we let $E(x) = p_0 + p_2 x + \dots + p_{n-2} x^{n/2-1}$ and $O(x) = p_1 + p_3 x + \dots + p_{n-1} x^{n/2-1}$, then $P(x) = p_1 + p_2 x + \dots + p_{n-1} x^{n/2-1}$ $E(x^2) + xO(x^2)$, and then FFT(p,n) can be expressed as a divide-and-conquer algorithm:

- 1. Compute E' = FFT(E, n/2) and O' = FFT(O, n/2).
- 2. For $i = 0 \dots n-1$, assign $P(\omega_n^i) \leftarrow E((\omega_n^i)^2) + \omega_n^i O((\omega_n^i)^2)$
- (a) Let $p = [p_0]$. What is FFT(p, 1)?

(a) Let
$$p = [p_0]$$
. What is $FFT(p, 1)$?

$$\begin{bmatrix}
P(1) \\
D
\end{bmatrix} = D
\end{bmatrix} \rightarrow retwn \quad D$$
(b) Use the FFT algorithm to compute $FFT([1, 4], 2)$ and $FFT([3, 2], 2)$.

$$FFT([1], 1) = 1 \qquad FFT([4], 1) = 4$$

$$P(W_2) = P(1) \qquad P(W_2') = P(e^{\pi i}) = P(-1)$$

$$E(1) \qquad E(1) \qquad E(-1)$$

$$E(2) \qquad E(-1) \qquad E(2) \qquad E(-1)$$

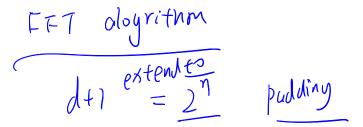

$$E(3) \qquad E(-1) \qquad E(1) \qquad E(1) \qquad E(1) \qquad E(1) \qquad E(1) \qquad E(1)$$

$$P(1) \qquad P(1) \qquad P(1) = D(1) \qquad E(1) \qquad$$

$$P(i) = \begin{cases} P(i) = E(i) + D(i) = 10 \\ P(i) = E(i) + i * 0 + i * 0 + i * 0 \end{cases}$$

$$P(i) = E(i) + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i * 0 + i *$$

(d) Describe how to multiply two polynomials p(x), q(x) in coefficient form of degree at most d.

2 Cubed Fourier

(a) Cubing the 9^{th} roots of unity gives the 3^{rd} roots of unity. Next to each of the third roots below, write down the corresponding 9^{th} roots which cube to it. The first has been filled for you. We will use ω_9 to represent the primitive 9^{th} root of unity, and ω_3 to represent the primitive 3^{rd} root.

$$\omega_{3}^{0}: \omega_{9}^{0}, \forall q, \forall q$$
 $\omega_{3}^{1}: \forall q, \forall q, \forall q$
 $\omega_{3}^{2}: \forall q, \forall q, \forall q, \forall q$

(b) You want to run FFT on a degree-8 polynomial, but you don't like having to pad it with 0s to make the (degree+1) a power of 2. Instead, you realize that 9 is a power of 3, and you decide to work directly with 9th roots of unity and use the fact proven in part (a). Say that your polynomial looks like $P(x) = a_0 + a_1x + a_2x^2 + \ldots + a_8x^8$. Describe a way to split P(x) into three pieces so that you can make an FFT-like divide-and-conquer algorithm.

$$E^{(N)} = 0.0 + 0.3 \times + 0.6 \times^{2} \qquad E^{9} = FFT(E, 3)$$

$$O(M) = 0.1 + 0.4 \times + 0.7 \times^{2} \qquad O^{9} = FFT(O, 3)$$

$$P(N) = 0.2 + 0.5 \times + 0.8 \times^{2} \qquad R^{9} = FFT(O, 3)$$

$$P(N) = E(N^{3}) + NO(N^{3}) + N^{2}R(N^{3})$$

$$P(N^{1}) = E(N^{1}) + N^{1}O(N^{1}) + (N^{1})^{2}R(N^{1})$$

$$N) = 3T(\frac{N}{3}) + O(N)$$

3 Predicting a Weighted Average

You have a time-series dataset $y_0, y_1, \ldots, y_{n-1}$ where all $y_i \in \mathbb{R}$. You are given fixed coefficients c_0, \ldots, c_{n-2} , which give the following prediction for day $t \geq 1$:

$$\widehat{p_t} = \sum_{k=0}^{t-1} c_k y_{t-1-k}$$

You would like to evaluate the accuracy of this prediction on the dataset by computing the *mean* squared error, given by

$$\frac{1}{n-1} \sum_{t=1}^{n-1} (p_t - y_t)^2$$

Find an $\mathcal{O}(n \log n)$ time algorithm to compute the mean squared error, given dataset $y_0, y_1, \ldots, y_{n-1}$ and coefficients c_0, \ldots, c_{n-2} .

Hint: Recall that if $p(x) = p_0 + p_1 x + p_2 x^2 + \dots + p_{n-1} x^{n-1}$ and $q(x) = q_0 + q_1 x + q_2 x^2 + \dots + q_{n-1} x^{n-1}$, then their product is $p(x) \cdot q(x) = r(x) = r_0 + r_1 x + \dots + r_{2n-2} x^{2n-2}$, where

$$r_j = \sum_{k=0}^{j} p_k q_{j-k}$$
